# What is the 3E Series?

3E is the new range of cast resin transformers developed by Trasfor for utilization within the electricity distribution sector. The key features of the 3E series transformers are embodied in the name of the range itself. 3E transformers are clearly defined for being:

## Efficient

No-load losses and load losses are reduced and able to satisfy the most demanding requirements.

Transformers are capital goods with a service life of decades and as such costs arising from losses represent the major part of their through life cost.

Reducing transformer losses is Trasfor's commitment to help its customers reduce their long term running costs.

## Ecological

All materials used to manufacture the 3E transformers are completely recyclable and eco-compatible.

The absence of dielectric fluids and potentially pollutant substances make these products environmentally friendly. This is Trasfor's commitment to protect the environment not only for people today but for generations to come.

## Economical

Trasfor understands the value of money.

The 3E range represents great economic value whilst delivering outstanding quality and performance.

Trasfor's experience in the design and manufacturing of specialised cast resin transformer over the last 35 years places the company in a unique position. The ability to utilise technologies and materials developed during this period allows us to deliver the very highest quality product at a very competitive price.

Trasfor's 3E series transformers are designed and manufactured in accordance with the standard **IEC60076-11**, Ed. 1-0 May **2004**.

All 3E transformers comply with:

- » Environmental class **E2**: capable to be used in the presence of frequent condensation and heavy pollution
- » Climatic class **C2**: suitable for operation, transport and storage at ambient temperatures down to -25°C
- » Fire behaviour class **F1**: self-extinguishing, free from halogens, with no emission of toxic substances and opaque smoke.

# Why Cast Resin Transformers?

Cast resin transformers are the natural choice for the distribution of electrical energy.

There are numerous advantages in the selection of a cast resin transformer over the traditional fluid cooled transformer design.

## Low Fire Risk

- » Dry insulation system, No flammable or high flame point fluids
- » Materials are self extinguishing
- » Materials are Low Smoke/Zero Halogen
- » No need for security devices for fire survey

## Environmentally Friendly

- » No danger of liquid spillage
- » All materials recyclable
- » Eco-friendly materials and manufacturing processes

## Reduced Installation and Construction Costs

- » Installed indoors, close to the load centre
- » Shorter LV cable runs; reduced cable and installation costs
- » Reduced construction costs (no leakage containment or blast wall required)

## Overload capability

- » Excellent short time overload capability due to the low current density in the windings and the high time constant of the coils
- » Overloads to IEC60905 - Loading Guide for Dry Type Transformers

## Increase in performance

- » Increased ratings to match 'unforeseen' higher demand using cooling fans.
- » Forced air cooling fans easily retro fitted to provide extra capacity

## Designed for Reliability

- » Excellent dielectric strength
- » Optimised short circuit withstand strength
- » Good resistance to humidity and atmospheric pollution
- » Resistance to shock and vibration

## Maintenance

- » Practically maintenance free
- » Designed for a minimum 25 year life expectancy.

Shopping malls, hospitals, civil and sport facilities, airports, barracks, museums, public and private office blocks: these are only some examples of the wide field of applications of Trasfor's 3E Series transformers.

# Magnetic core

No-load losses, noise and no-load currents: these are crucial features of a high-quality transformer and they depend on the magnetic core. As a result, the choice of a high-quality core is vital. This is what underlies design and manufacturing of all the 3E Series transformers cores.

- » High-permeability and low-loss grain-oriented steel sheets
- » Pre-coating with a high temperature inorganic insulating material, which minimises losses due to eddy currents

- » 45° step-lap assembling of the sheets, which minimises stray-flux losses and prevents joint vibrations
- » Final coating of the complete assembly by spray painting, which gives protection to the core against corrosion and, by infiltrating between the individual core sheets, sticks them together with benefits in terms of noise emission and resistance to vibrations.

# Low voltage windings

- » The Low Voltage coils utilised in Trasfor 3E Distribution Transformers are produced using concentrically wound aluminium foil. This technique produces a very compact and mechanically strong coil
- » The width of the foil equals the length of the coil. Under load conditions the temperature within the LV winding distributes itself uniformly along the axial length of the coil and helps to reduce hot spot conditions
- » The insulation material used throughout the winding is Class F, suitable for a designed average winding rise of 100°C for use in a 40°C peak ambient environment

- » The whole winding is impregnated in a bath of epoxy resin
- » The complete LV coil assembly is processed under vacuum conditions providing outstanding resistance against contamination from normal atmospheric pollution and excellent mechanical strength under short circuit conditions.
- » LV terminations are located at the top of the coil and are drilled with a number of holes relating to the transformer rating.

# High voltage windings

- » The High Voltage coils utilised in Trasfor 3E Distribution Transformers are produced using concentrically wound aluminium foil conductor
- » The complete HV winding assembly is cast under vacuum using a Class F epoxy resin
- » The vacuum process removes air from within the winding and the resin which in turn eliminates small voids or air 'bubbles' within the finished casting
- » The HV casting can now be considered to be essentially 'discharge free' and will greatly enhance the long term reliability of the complete transformer

- » The insulation material used throughout the winding is Class F with a designed average winding rise of 100°C for use in a 40°C peak ambient environment
- » The coils are provided with high voltage off-circuit regulating taps, normally set at  $\pm 2 \times 2.5\%$
- » HV terminations are located at the top of the coil and are drilled with 1 fixing hole.

## Why HV Foil Windings?

### **There are a number of major advantages:**

- » The HV foil winding technique produces 'inter-coil' voltage stresses significantly lower than those of a comparable traditional design. In a conventional wire winding, the inter-layer voltage can be much higher than the inter-turn voltage, as two facing conductors belonging to two adjacent layers can belong to two distant turns (the interval between them can be of several intermediate turns). In a foil winding the inter-layer voltage is equal to the single inter-turn voltage.
- » The HV foil design has excellent dielectric performance. The capacitive nature of the foil design provides almost uniform voltage distribution of any transient surges and avoids unnecessary dielectric stress during switching operations.

- » The flat surface of the foil ensures a superior and more homogeneous resin penetration, favouring the total absence of any void inside the casting.
- » The combination of the cast resin system together with HV foil winding technology produces a high mechanical 'hoop' strength and resistance to radial forces under short circuit conditions.

## Why Aluminium instead of Copper?

Trasfor has for many years produced transformers for a wide range of markets utilising both aluminium and copper winding conductors. We have the knowledge and experience to be objective with either conductor material.

Both winding materials provide low loss, highly reliable transformers of equal technical performance. However there are two key advantages in using aluminium: one technical and one economical.

Technically the coefficient of expansion of aluminium is more closely matched to that of the more commercially available epoxy casting resins. This is particularly relevant if the transformer is subjected to rapid changes of load during the duty cycle or significant overloads.

Secondly there is the economic consideration. For the same current carrying capacity an aluminium conductor

would need to be circa 64% larger in cross section than the equivalent copper conductor. This results in a copper transformer being marginally smaller but slightly heavier than the aluminium equivalent. However the density of aluminium compared with copper means that the mass of the aluminium winding is still 50% lower than the equivalent copper design. This, in turn, results in a very significant difference in the cost of the winding conductor material and in the finished transformer. It is for this very reason that aluminium is the chosen winding conductor for the vast majority of cast resin manufacturers in the world today. Commodity prices for aluminium and copper vary from year to year but the copper transformer will always be significantly more expensive than the equivalent aluminium design – With no technical difference in performance!

# What tests are performed on the 3E series transformers?

At the end of the manufacturing process each 3E transformer produced is subjected to a complete cycle of **Routine Tests** in our laboratory.

#### **These tests ensure:**

- » Full compliance with IEC60076-11 international standard
- » Long term reliability
- » Compliance with individual customer specifications
- » Confirmation of requested technical performance.

Additionally these tests and the results achieved give Trasfor the feedback and statistical data necessary to continuously improve its design and manufacturing processes.

#### **Each transformer is subjected to the following tests:**

- » Measurement of winding resistance
- » Measurement of voltage ratio and check of phase displacement

- » Measurement of short-circuit impedance and load loss
- » Measurement of no-load loss and current
- » Separate-source AC withstand voltage test
- » Induced AC withstand voltage test
- » Partial discharge measurement

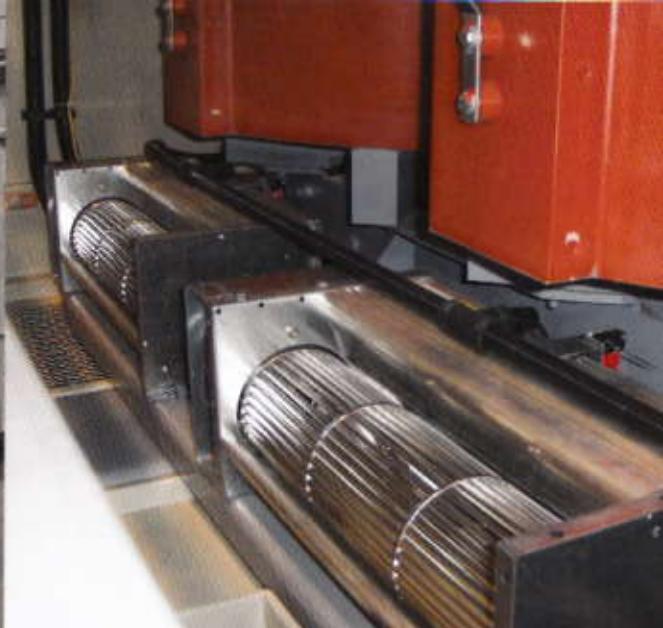

On request the following **Type Tests** can be carried out:

- » Lightning impulse test
- » Temperature-rise test

It is also possible to carry out also the following **Special Tests**, either inside our laboratories or at external third party certified test centres:

- » Measurement of sound level
- » Short-circuit test

Each transformer is supplied with a test certificate detailing the tests conducted and the results achieved.

# What accessories are available?

The 3E Series transformers are designed for indoor use and can be supplied as open style (IP00) construction or enclosed in sheet steel enclosures providing improved safety to personnel or offering environmental protection. Standard protection degrees are IP21, IP23 or IP31.

Special enclosure designs can be made available on request for higher protection degrees or for specific outdoor applications.

## Standard accessories

### Standard fittings for all open style (IP00) 3E transformers:

- » 6 PTC thermal sensors (2 each phase) or 3 PT100 thermal sensors (1 each phase), installed in the LV windings and terminated in a centralized auxiliary circuit box
- » 4 bi-direction rollers
- » 4 lifting lugs
- » 2 earthing terminals
- » 1 rating plate
- »  $\pm 2.5\%$  and  $\pm 5\%$  HV tappings (via off-circuit removable bolted links)
- » 3 HV aluminium connection terminals (top mounted for cable entry from above)
- » 4 LV aluminium connection bars (top mounted for cable/baretry from above)
- » 1 routine test certificate
- » 1 installation and maintenance manual

## Optional accessories

### Options available on demand:

- » Additional PTC thermal sensors or PT100 thermal sensors, installed in the LV windings and cabled in a centralized auxiliary circuit box
- » Thermal relay for PTC thermal sensors (without temperature display)
- » Temperature monitor relay for PT100 thermal sensors (with digital temperature display)
- » Temperature monitor relay with analogue output 4-20 mA or digital output ModBus for remote temperature control
- » Set of forced ventilation cooling fans (6 radial fans)
- » Control relay for forced ventilation cooling fans
- » Set of 3 HV cast terminations (for use with separable 'elbow' connectors supplied by others)
- » Set of 4 anti-vibration mounts (for mounting under bi-directional rollers)
- » Electrostatic shield between primary and secondary windings
- » Protection housing IP21, IP23 or IP31 for indoor installation
- » Set of 3 HV Surge arresters
- » Earthing kit equipment (ball bolts and earth connecting bars).

For further additional accessory not listed above please contact Trasfor.

(2) Preliminary data.

# LV and HV Terminations

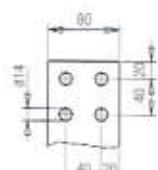

## LV TERMINALS

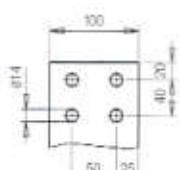

100 to 250 kVA  
thickness 5

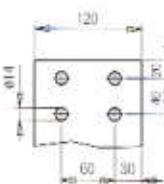

315 to 500 kVA  
thickness 6

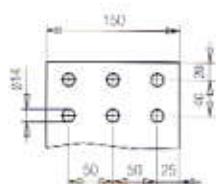

630 kVA thickness 5

800 kVA thickness 10  
1000 kVA thickness 15

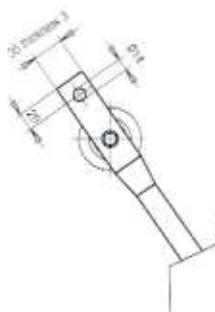

1250 kVA thickness 10

1600 kVA thickness 10  
2000 kVA thickness 12

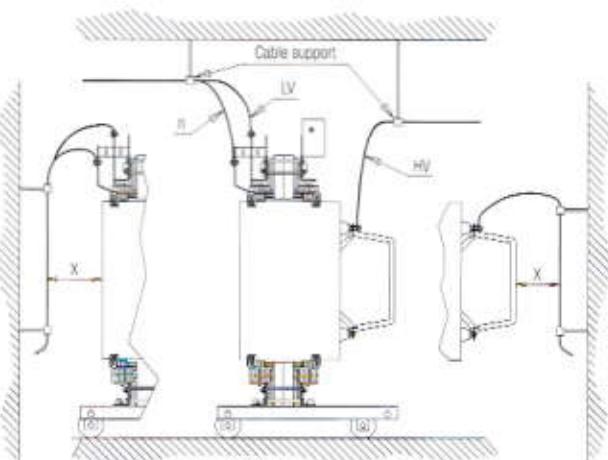

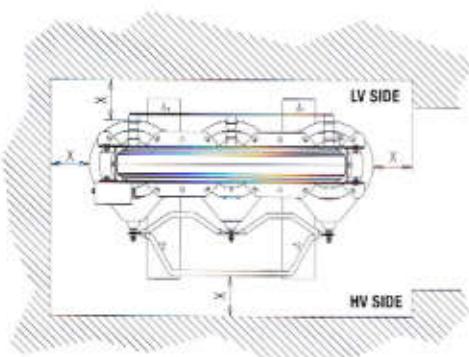

## HV TERMINALS

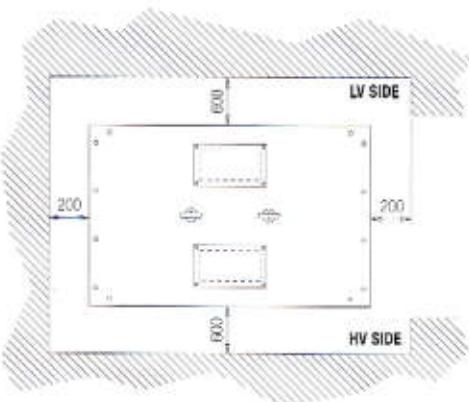

2500 kVA thickness 2x15

# Connections and Clearances

Minimum clearance required for safety reason  
and terminal connections

Minimum clearance required for maintenance

Insulation class (kV)	X dimension (mm)
7.2	90
12	120
17.5	165
24	220

# What service can you trust?

Worldwide Consulting, Maintenance, Technical Assistance & Service. To consolidate its position Trasfor has created an additional service arm to offer a complete technical consultancy, ranging from project specific engineering studies to routine inspection and maintenance.

**Trasfor Consulting** offers a unique world-class service for any type of transformer, starting from commissioning, through scheduled and unscheduled maintenance and immediate intervention.

**Trasfor Consulting** team of qualified and certified experts is ready 24/7 to fly all over the world and face any level of emergency situation, reducing to the minimum your down time.

For more in-depth technical analysis **Trasfor Consulting**, through a pool of specialist, electrical, mechanical and structural engineers, is able to assist with specific product developments and provide solutions to the most complex technical requests.

We analyze your installation and we suggest to you a list of the most important and critical spare parts.

# Quality

- » Quality as ISO certification 9001:2000
- » Quality as total respect of environment with ISO 14001-2004
- » Quality for the railway industry as IRIS - International Railways Industry Standard
- » Quality of products and person through ISO EN 3834-2, EN 15085, UL File E172880 and UL File E216928 certification
- » Certificate of conformity to GOST R

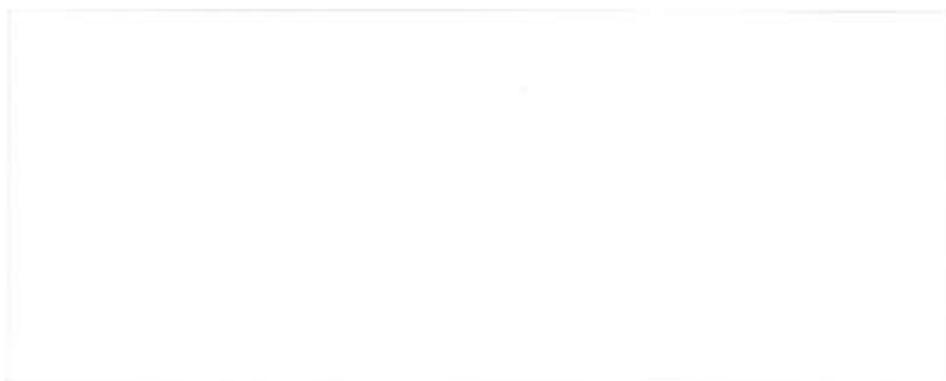

Quality through entrustment by the following certifying bodies:

**ABS** - American bureau of shipping

**DNV** - Det norske veritas

**GL** - Germanischer Lloyd

**Standards:** all int. standards such as IEC, BS, CSA, UL, VDE/DIN, ABS, BV, ANSI, DNV, LRS, etc.
